

School BCBA Transformation Program

Professional Development Documentation Packet

Program abstract

This six-week applied professional-development cohort prepares certified BCBAs to make school-based assessment and implementation decisions across student, staff, team, and system levels. The curriculum addresses referral triage, functional-hypothesis testing, school-relevant functional-analysis formats, ACT-informed contextual assessment, evidence-to-intervention alignment, and implementation through school teams.

Participants apply the work, to the best of their ability, to a student, staff member, team, or system in their current setting. Application remains within each participant's role, competence, permissions, safety procedures, and local requirements.

FORMAT	Six live weekly sessions
SCHEDULE	Current cohort dates and meeting times are confirmed before enrollment
AUDIENCE	Certified BCBAs working in or entering K-12 school practice
COHORT	Small cohort
PAY IN FULL	\$1,997
PAYMENT PLAN	Three automatic monthly payments of \$697 (\$2,091 total)
DISTRICT BILLING	Purchase orders and invoice payments accepted

Continuing education

Learning CEUs are included for eligible sessions completed under the program's attendance and participation requirements. The exact number available and documentation requirements are provided with enrollment materials.

Recordings

Live sessions are recorded and made available in the student portal within 24 hours.

Six weeks of applied decision-making

Each week begins with a recurring school-practice problem and connects the methods to work in the participant's current setting.

01

From referral to assessment decision

Build a repeatable way to clarify the concern, review context, and select an assessment path proportionate to the case.

02

Testing the functional hypothesis before the BIP

Examine how testing a functional hypothesis can clarify intervention selection before BIP development, including when experimental analysis is warranted and feasible.

03

School-based functional analysis formats

Study brief, trial-based, latency, precursor, and analog FA, then select and plan around school constraints, safety, assent, and authorization.

04

ACT-informed functional assessment

Use ACT-informed interview and mapping tools to examine rule-governed and avoidance patterns while keeping conclusions tied to observable behavior and testable hypotheses.

05

From assessment evidence to intervention

Translate what the team knows into feasible prevention, teaching, reinforcement, response, and progress-monitoring decisions.

06

Leading implementation through teams

Build the communication, training, fidelity, review, and escalation routines needed to lead behavior support through other people.

Functional-analysis methods addressed

Brief, trial-based, latency, precursor, and analog functional analyses. Selection depends on the referral question, case, setting, practitioner competence, safety, authorization, and feasibility.

Assessment distinction

Indirect and descriptive assessment can inform hypotheses and FA design, but they do not demonstrate a causal functional relation. A functional analysis systematically compares test and control conditions to evaluate a functional relation.

Scope and safeguards

Not every student requires a functional analysis. Any analysis must fit the practitioner's competence, role, authorization, safety planning, assent practices, and local requirements.

Assessment decisions and hypothesis testing

By the end of each weekly session, participants will be able to complete the objectives listed for that topic within the boundaries of their role and competence.

01

From referral to assessment decision

Build a repeatable way to clarify the concern, review context, and select an assessment path proportionate to the case.

LEARNING OBJECTIVES

- Identify the referral question, decision to be made, and information needed before selecting assessment methods.
- Distinguish indirect, descriptive, ecological, and experimental assessment contributions without treating them as interchangeable evidence.
- Select an assessment path that is proportionate to the question, risk, available evidence, school context, and feasibility.

02

Testing the functional hypothesis before the BIP

Examine how testing a functional hypothesis can clarify intervention selection before BIP development, including when experimental analysis is warranted and feasible.

LEARNING OBJECTIVES

- State a functional hypothesis as a testable relation between environmental events and observable behavior.
- Explain how testing a functional hypothesis can reduce reliance on an unverified explanation when selecting intervention components.
- Determine whether additional hypothesis testing is warranted and feasible before a BIP is finalized or implemented.

03

School-based functional analysis formats

Study brief, trial-based, latency, precursor, and analog FA, then select and plan around school constraints, safety, assent, and authorization.

LEARNING OBJECTIVES

- Distinguish brief, trial-based, latency, precursor, and analog functional-analysis formats by their arrangements and dependent measures.
- Select a functional-analysis format that fits the referral question, target behavior, risk, setting, and available resources.
- Specify the competence, authorization, assent, safety, and feasibility considerations that must be addressed before implementation.

Context, intervention, and systems leadership

04

ACT-informed functional assessment

Use ACT-informed interview and mapping tools to examine rule-governed and avoidance patterns while keeping conclusions tied to observable behavior and testable hypotheses.

LEARNING OBJECTIVES

- Identify reported rules, avoidance patterns, private events, and contextual variables that may inform further assessment.
- Use an ACT-informed interview or mapping process to organize contextual information without treating reported experience as demonstrated behavioral function.
- Translate ACT-informed assessment information into observable, testable hypotheses that remain within the participant's school-based role.

05

From assessment evidence to intervention

Translate what the team knows into feasible prevention, teaching, reinforcement, response, and progress-monitoring decisions.

LEARNING OBJECTIVES

- Evaluate whether proposed BIP components are aligned with the available assessment evidence and functional hypothesis.
- Select feasible prevention, teaching, reinforcement, and response components for the student and implementation context.
- Specify progress-monitoring measures and review points needed to evaluate implementation and guide revision.

06

Leading implementation through teams

Build the communication, training, fidelity, review, and escalation routines needed to lead behavior support through other people.

LEARNING OBJECTIVES

- Define the observable staff actions, responsibilities, and communication needed to implement a behavior-support plan.
- Design a practical staff-training and fidelity-review routine for a current school context.
- Establish review and escalation steps for responding when implementation or student-response data indicate that the plan needs attention.

Documentation for supervisors and purchasing offices

Applied work

Participants apply each week's work directly to a student, staff member, team, or system when appropriate and permitted. Participants define a testable functional hypothesis for a current case and decide whether and how it could be tested safely and feasibly. They also use a school-based FA planning guide, ACT-informed contextual assessment map, evidence-to-intervention check, staff training and fidelity routine, and caseload review system.

Instructor

Rob Spain, BCBA, IBA, brings more than 25 years of behavior-analytic work across school, district, teaching, and clinical settings.

District payment process

District purchase orders and invoice payments are accepted. A seat is held after a signed purchase order or written district payment approval is received. A W-9 and supporting program documentation are available on request.

VENDOR	Behavior School LLC
PROGRAM	School BCBA Transformation Program
TUITION	\$1,997 per participant
PAYMENT PLAN	Three automatic monthly payments of \$697 (\$2,091 total)
CONTACT	Rob Spain, BCBA - rob@behaviorschool.com
WEBSITE	behaviorschool.com/transformation-program
W-9	Available upon request

Refund policy

A refund may be requested within five calendar days of payment. After that window, cohort seats are committed and are not refundable except where required by law.
